Sprint 2 – SAD/SRS Deviation Report

Project: Electronics Store Inventory Management System (ESIMS)
Team: 15
Prepared by: Niharika Shridhar Murthy
Sprint: Sprint 2

1. Purpose

This document identifies implementation differences, extensions, and pending verification items against the approved Software Requirements Specification (SRS) and Software Architecture Document (SAD).

2. Requirements and Implementation Review

Area	Approved SAD/SRS	Implementation / Observation	Status
Authentication	Login, logout and session-based access control	Authentication and protected routes implemented	Compliant
Inventory management	Add, edit, delete and view components	Inventory CRUD functionality implemented	Compliant
Search and filtering	Search by name, category and stock status	Search and filtering functionality implemented	Compliant
SKU validation	Unique SKU for each component	SKU uniqueness validation implemented	Compliant
Stock classification	Available, Low Stock and Out of Stock	Stock classification implemented	Compliant
Database architecture	Flask application with SQLite	Flask and SQLite architecture followed	Compliant
CSV export	Export inventory/report data	CSV export functionality implemented	Compliant
Role-based permissions	Admin/Store Manager access described in SRS	Additional role distinctions may exist in implementation	Extension – verify

Audit logging	Not explicitly specified as a core SRS requirement	Audit logging may be an additional implementation feature	Extension – verify

3. Non-Functional Requirements Requiring Verification

The following requirements require evidence from final testing:

- Performance: response time below 2 seconds with 1,000 components.
- Usability: common tasks completed within the specified time.
- Reliability: inventory data persists after application restart.
- Portability: compatibility across supported operating systems.
- Security: parameterized SQL queries and appropriate session protection.

4. Summary

The implementation follows the primary architecture and functional requirements defined in the approved SAD and SRS. Additional implementation features, if confirmed, are documented as extensions rather than deviations.

Performance, usability, portability and other measurable requirements must be supported by final test evidence before being declared fully verified.

5. Conclusion

The project has been reviewed against the approved SAD and SRS. The identified extensions and pending verification items will be considered during final integration, testing and project closure.
